1. Introduction

The **PAYONE Commerce Platform** is designed to support a merchant's payment-related use cases across all sales channels within a single system. It provides centralized payment handling and enhances order management by supplying dedicated statuses for both the checkout process and the individual shopping cart items associated with payment.

To support integration across channels, the PAYONE Commerce Platform offers a clearly defined business API for **webshops, mobile applications, and point-of-sale (POS)** environments. Its order management capabilities include functionally defined operations on shopping cart items, helping to reduce payment complexity and improve the consistency of payment-related processes.

The platform is designed to operate alongside existing terminal and acquiring communication without interfering with it. Information about terminal transactions is received directly from the acquiring side, which means that no terminal updates or hardware replacement are required. As a result, the stability and availability of terminal payments at the POS remain unaffected.

The PAYONE integration for **Salesforce Commerce Cloud (SFCC) SFRA storefronts** is delivered as a self-contained cartridge set. This integration extends the standard SFRA checkout flow by adding PAYONE payment methods and introduces additional **Business Manager** functionality to support post-order payment operations such as **capture, refund, and cancel**.

The solution is installed in Salesforce Commerce Cloud through cartridge path configuration, metadata import, and Business Manager setup. It introduces storefront checkout enhancements, custom site preferences, custom attributes for payment tracking, PAYONE service integration, and an extension for payment operations in the **Business Manager Customer Service Center**.

Use of the integration requires a direct contractual relationship with PAYONE, and the relevant payment methods must be enabled for the merchant account. Merchants must configure the

required PAYONE credentials and settings, such as **Merchant ID, API Key, API Secret, environment**, and any payment-method-specific identifiers needed for the selected payment methods. Any PAYONE transaction fees, wallet provider fees, or other commercial terms remain subject to the merchant's agreement with PAYONE and the respective payment providers.

The scope of the solution includes deployment of **the PAYONE cartridges, SFRA storefront integration, Business Manager configuration, custom metadata import, webhook-based payment status synchronization**, and **Customer Service Center** support for payment operations.

2. Functional Overview

The **PAYONE Commerce Platform** is designed to support merchants throughout the entire customer journey by providing flexible payment integration options tailored to different business requirements. Because every business operates differently, the platform offers multiple integration approaches to accommodate varying levels of complexity, channel interaction, and checkout design.

At the core of the customer journey is the **checkout process**, where a smooth and reliable payment experience is essential for successful conversion. Within this process, the **PAYONE Commerce Platform** acts as the central system for adding, modifying, tracking, and retrieving customer and payment-related information.

The **PAYONE cartridge** integrates into the standard Salesforce **Commerce Cloud (SFCC) SFRA** checkout flow and extends it with PAYONE payment processing capabilities. Based on the selected payment method, the cartridge supports different payment collection mechanisms, including PAYONE-hosted card tokenization, wallet approval flows, and storefront payment forms. These capabilities are incorporated into the standard Place Order step to enable payment authorization as part of the normal checkout process.

After the shopper places the order, the cartridge creates or completes the corresponding PAYONE checkout, stores the relevant PAYONE identifiers in the Salesforce Commerce Cloud

payment transaction, and manages redirect-based payment flows where required. For payment methods that include an external authentication or approval step, such as **3-D Secure** or wallet redirection, the shopper is returned to the storefront after the external step is completed, and the order is finalized once the PAYONE response has been successfully validated.

In addition to storefront checkout support, the cartridge includes an extension for the **Business Manager Customer Service Center**. This extension enables customer service users to perform post-order payment operations directly within Salesforce Commerce Cloud, including capture, refund, and cancel actions at order level and, where applicable, at item level.

2.1. Key Functional Features

The PAYONE cartridge provides the following core features:

- ✓ Integration with the standard SFRA checkout flow for PAYONE payment processing
- ✓ Hosted card tokenization for credit card payments
- ✓ Wallet integrations for **PayPal**, **Google Pay**, and **Apple Pay**
- ✓ Support for **SEPA Direct Debit**, **PAYONE Secured Invoice**, **PAYONE Secured Installment**, **PAYONE Secured Direct Debit**, and **Store Pay / Pay in Store**
- ✓ **Business Manager / Customer Service Center** support for capture, refund, and cancel operations
- ✓ Webhook and order update support for asynchronous payment status handling
- ✓ Configuration through Business Manager site preferences and imported metadata
- ✓ Adaptability for multi-locale storefront implementations

2.2. Supported Payment Methods

The integration supports the following payment methods:

- Credit Card
- PayPal
- Google Pay
- Apple Pay
- SEPA Direct Debit
- PAYONE Secured Invoice
- PAYONE Secured Installment
- PAYONE Secured Direct Debit
- Store Pay / Pay in Store

The cartridge is designed for **SFRA storefronts** and supports the storefront locales configured in Salesforce Commerce Cloud. Localized storefront texts and payment method labels can be adapted as part of the implementation to align with the merchant's localization and market strategy.

2.3. Supported Use Cases

The PAYONE cartridge supports shopper checkout processes, merchant post-order payment operations, and asynchronous payment status synchronization.

2.3.1. Shopper Checkout Use Cases

The integration supports payment processing for both registered and guest customers, including the following use cases:

- Paying by credit card using PAYONE-hosted card fields and tokenization
- Paying by PayPal through the PAYONE PayPal JavaScript SDK flow
- Paying by Google Pay
- Paying by Apple Pay

- Paying by SEPA Direct Debit
- Paying by PAYONE Secured Invoice
- Paying by PAYONE Secured Installment
- Paying by PAYONE Secured Direct Debit
- Paying by Store Pay / Pay in Store
- Completing redirect or 3-D Secure return flows and finalizing the order on the storefront

2.3.2. Merchant Post-Order Use Cases

Customer service or operational users can perform the following actions from the **Business Manager Customer Service Center**:

- Capture payments
- Refund payments
- Cancel payments

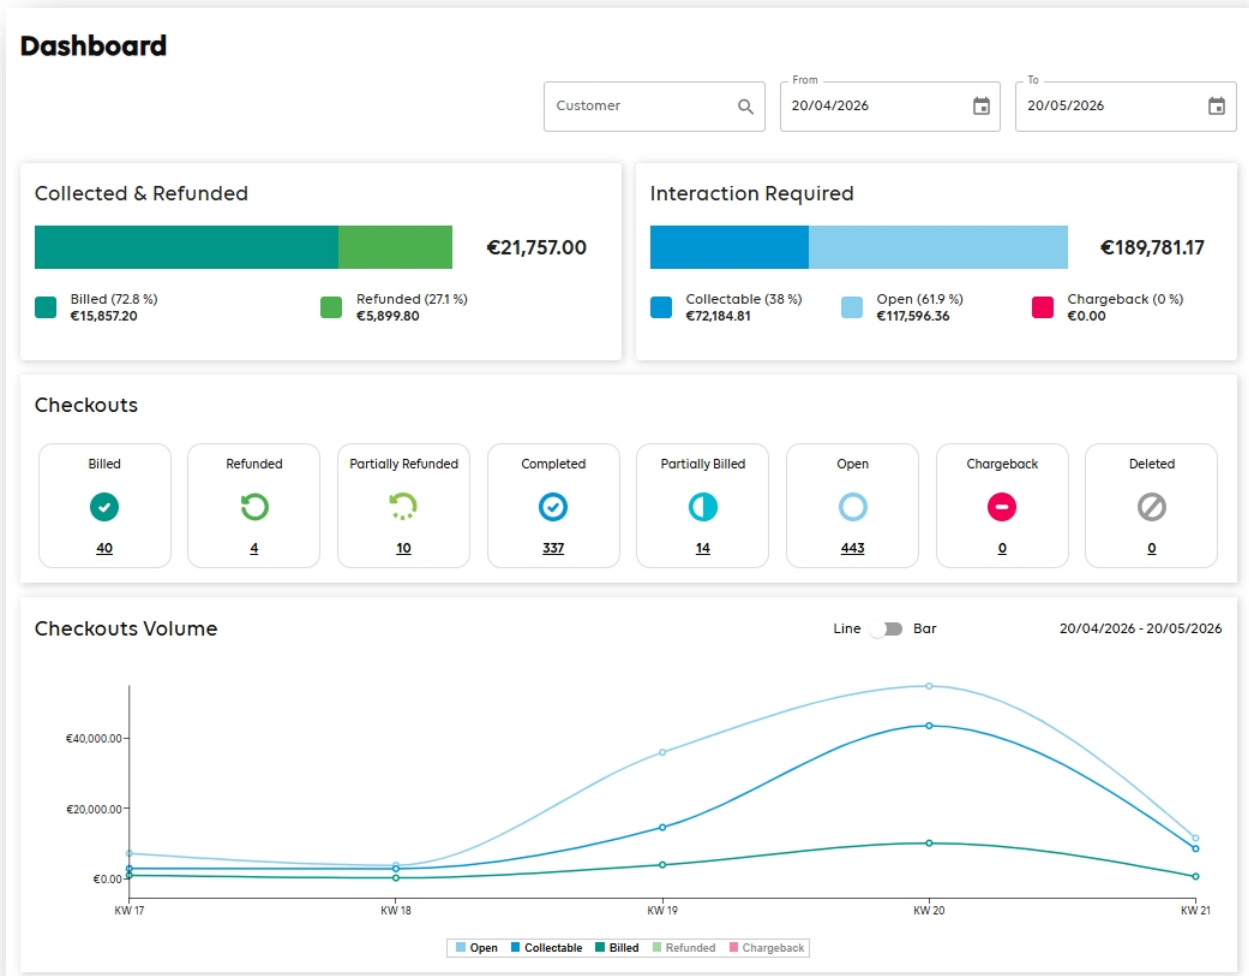

3. PAYONE Commerce Portal

Commerce Portal provides a centralized interface for monitoring key business indicators, reviewing checkout-related information, and performing follow-up payment actions. In addition to its operational and reporting capabilities, the portal also serves as the main location for configuration and administration tasks, including **API authentication, user management,** and **data protection settings**.

3.1. Dashboard

The **Commerce Portal Dashboard** is designed to provide an overview of selected merchant key performance indicators (KPIs). To support this, the dashboard includes a variety of **widgets** that retrieve and calculate KPIs based on the merchant data available in the Commerce Platform.

Many of these widgets display checkout and customer-related data in order to provide business insights and help merchants better understand shopper behavior and purchasing trends. The accuracy of the displayed KPIs depends largely on the completeness and consistency of the merchant data provided to the platform. If data is incomplete or inconsistent, certain metrics may be inaccurate or only partially representative.

3.2. Checkouts

The **Checkout Overview** section is divided into two widgets that are designed to help merchants quickly identify whether follow-up action may be required. This indication is based on the amounts associated with the respective checkout statuses.

The **Checkouts** dashboard widget provides an overview of the total number of checkouts within the selected time period, grouped by status. Each displayed checkout count is interactive and can be selected directly. When a checkout status is selected, the corresponding filter criteria, including the chosen time period and checkout status, are automatically applied in the Checkouts tab, where the filtered results are displayed for further review.

Each checkout entry typically includes the following information:

- **Date** - Displays the date and time when the checkout was created or processed. This helps users identify the relevant transaction period and supports filtering and reporting activities.
- **Customer ID** - Displays the identifier associated with the customer linked to the checkout.
 - For **guest users**, this value differs from the identifier used for **registered or logged-in users**, allowing the system to distinguish between anonymous and authenticated customer journeys.
- **Checkout Reference** - Displays the reference value assigned to the checkout. This value is also available in **Salesforce Commerce Cloud Business Manager**, on the **Orders** page, where it can be used to correlate storefront orders with PAYONE checkout records.
- **Payment Method** - Indicates the payment method selected and used by the customer during checkout, such as Credit Card, PayPal, Apple Pay, Google Pay, Secured Installment, Sepa Credit Transfer, Secured Direct Debit, Secured Invoice, Direct Debit or other supported payment methods.
- **Payment Reference** - Displays the payment reference associated with the checkout. This reference is also shown in **Business Manager** on the **Orders** page and can be used to trace the related payment transaction across systems.
- **Post** - Displays the number of items included in the checkout. This value reflects the total quantity of products associated with the transaction.
- **Checkout Amount** - Displays the total amount of the checkout. This allows users to quickly review the financial value of the transaction.
- **State Icon** - Displays the current status of the checkout using an icon indicator. The state helps users quickly understand the current payment or processing situation for the checkout.

The following checkout statuses may be displayed:

- ✓ **Refunded** – The payment has been refunded fully or partially.
- ✓ **Pending Capture** – The payment has been authorized but not yet captured.

- ✓ **Rejected** – The payment was not approved or could not be processed successfully.
- ✓ **Captured** – The payment has been successfully captured.
- ✓ **Pending Completion** – The checkout process has started, but the payment or related processing has not yet been fully completed.

The **Checkouts** tab is intended to support operational monitoring and help users quickly locate checkout records based on transaction details, customer information, or payment status.

4. Business Manager

4.1. PAYONE Configuration - Custom Preferences

To configure the PAYONE site custom preferences, navigate in Business Manager to:

Merchant Tools > Site Preferences > Site Custom Preferences.

On the **Site Custom Preferences** page, locate the custom preference group named **PAYONE Configurations (payoneConfigurations)**.

This group contains the configuration settings required to enable and manage the PAYONE integration within the storefront and related payment flows.

- **Payone Enabled (payoneEnabled)** - This setting enables or disables (default value) the PAYONE storefront integration.
 - When enabled, the cartridge replaces the default SFRA payment options rendering with the PAYONE payment options flow and adds the required PAYONE checkout assets to the storefront.
- **Payone Environment (payoneEnvironment)** - This setting defines the active PAYONE environment. Supported values are:
 - Development (default value)
 - production
 - The selected environment determines whether the cartridge connects to the PAYONE pre-production or production Commerce Platform API endpoint.
- **Payone Merchant ID (payoneMerchantId)** - This setting stores the unique PAYONE Merchant ID used for Commerce Platform API requests and for the PAYONE Google Pay gateway configuration.
 - The Merchant ID can be found in the upper-right corner of the **PAYONE Merchant Interface (PMI)** after login. It is also used as a reference value for service-related requests.

- **Payone API Key (payoneApiSecret)** - This setting stores the PAYONE API Key used for authenticated server-to-server requests to the PAYONE Commerce Platform.
 - The API Key, together with the API Secret, is required to authenticate outgoing requests. These credentials can be retrieved and managed in the **Commerce Portal** under: **Configuration > API Authentication**
- **PAYONE SEPA Creditor ID (payoneSepaCreditorId)** - This setting stores the creditor identifier used when the cartridge creates **SEPA Direct Debit mandates**.
 - This preference is required if the **SEPA Direct Debit** payment method is enabled.
- **PAYONE Apple Pay - Integration Type (payoneApplePayIntegrationType)** - Supported values are:
 - MERCHANT_CERTIFICATE (MERCHANT_CERTIFICATE) - Uses your own Apple Pay merchant certificate. (default value)
 - MASS_ENABLEMENT (MASS_ENABLEMENT) - Uses the PAYONE certificate.
- **PAYONE Apple Pay - Use Shipping Address From Checkout Form (payoneApplePayUseShippingAddressFromCheckoutForm)** – This setting enables (default value) or disabled the use of the shipping address from the Checkout form instead of the one provided by Apple Pay interface
- **PAYONE Apple Pay - Use Billing Address From Checkout Form (payoneApplePayUseBillingAddressFromCheckoutForm)** - This setting enables (default value) or disabled the use of the billing address from the Checkout form instead of the one provided by Apple Pay interface
- **PAYONE Apple Pay - Use Shipping Method From Checkout Form (payoneApplePayUseShippingMethodFromCheckoutForm)** - This setting enables (default value) or disabled the use of the shipping method from the Checkout form instead of the one provided by Apple Pay interface
- **Payla Merchant ID (payonePaylaId)** - This setting stores the Payla partner_merchant_id used for the **PAYONE Secured Installment** device fingerprinting integration.
 - This identifier is provided during the Payla onboarding process and is used to identify the merchant or shop in the fingerprinting setup.

- **PayPal Merchant ID (payonePayPalMerchantId)** - This setting stores the **PayPal Merchant ID** that is passed as the merchant-id parameter to the PayPal JavaScript SDK used for PAYONE PayPal checkout.
 - Use the Merchant ID available in the **Business Information** section of the PayPal account.
- **Google Merchant ID (payoneGoogleMerchantId)** - This setting stores the **Google Merchant ID** used in the Google Pay storefront configuration.
 - This value is different from the PAYONE Merchant ID, which is used by the cartridge as gatewayMerchantId for the PAYONE Google Pay gateway integration.
- **Payone Error Mapping Override (payoneErrorCodeMappingOverride)** - This optional setting allows merchants to override the default mapping between PAYONE error codes and shopper-facing message keys.
 - The value must be provided as a valid JSON object:
 - JSON **keys** must be PAYONE error codes represented as strings
 - JSON **values** must be message keys from `payoneError.properties` or one of its localized variants, where available
 - This configuration allows merchants to customize the error messages displayed to shoppers for specific PAYONE error codes without modifying the cartridge logic.

Exemple:

```
➤ {  
➤   "50305001": "payone.error.invalid_request",  
➤   "50090002": "payone.error.payment_declined",  
➤   "6000400": "payone.error.your_custom_error_message"  
➤ }
```

4.2. PayOne WebHook

Commerce Webhooks provide a single, omnichannel stream of real-time commerce events as soon as they occur. These events may include changes in payment status, completed refunds, received payouts, checkout updates, recorded POS transactions, or case updates. Each notification is delivered as a standardized **HTTPS POST** request with a consistent **JSON** structure, regardless of whether the event originates from an online or in-store channel.

By using webhooks, the system receives event information immediately, eliminating the need to poll for status changes. This enables timely and automated follow-up actions such as releasing orders after capture, reconciling payouts, notifying support teams of updates, or forwarding newly available transaction data to reporting and analytics processes.

Within this implementation, **PAYONE Webhook processing** is used to support asynchronous payment event handling in **Salesforce Commerce Cloud (SFCC)**.

The webhook implementation includes the following **components**:

- A secure webhook controller endpoint for receiving PAYONE event notifications
- Queueing of incoming webhook events into a custom object named `PayoneWebhookEvent`
- A chunk-based job to process queued webhook events
- Automatic order placement or order failure handling based on the webhook payment status
- Email notifications for successfully placed orders and failed orders
- Order notes to support traceability and operational transparency
- Persistence of the Merchant Reference value to enable mapping of webhook events to the related orders

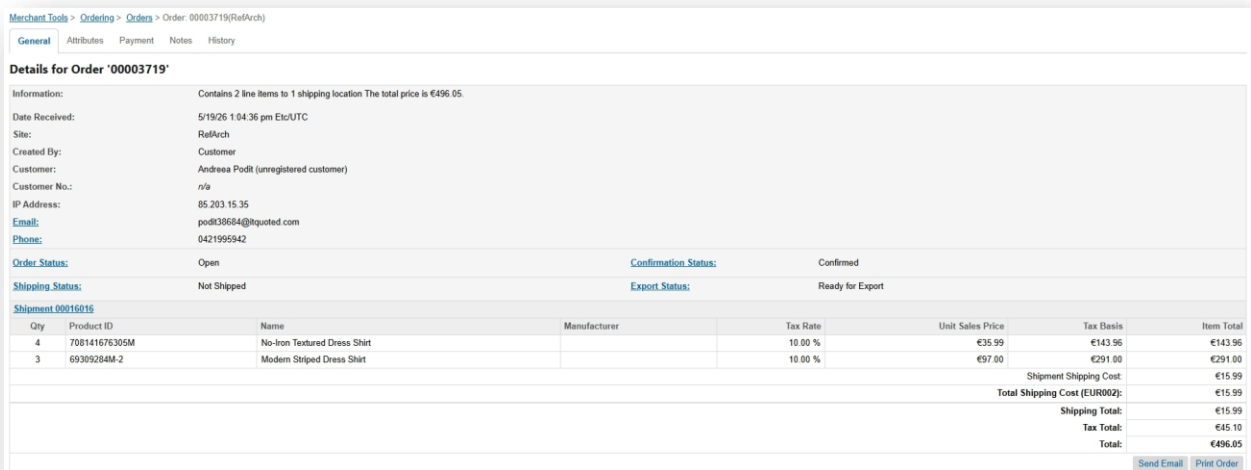

4.2.1. PayOne Webhook Event Custom Object

4.2.1.1. PayOne Order Details

After an order has been successfully placed using a supported payment method, the related PAYONE order and payment details can be reviewed in **Business Manager**.

To access the order information, go to the **Orders** page in Business Manager and search for and open the relevant **Order ID**.

1. In the **General** tab, review the customer details and the purchased products associated with the order.

The screenshot displays the 'Details for Order '00003719'' page in the PayOne Business Manager. The interface includes a breadcrumb trail 'Merchant Tools > Ordering > Orders > Order: 00003719(RefArch)' and tabs for 'General', 'Attributes', 'Payment', 'Notes', and 'History'. The 'General' tab is active, showing order information, customer details, and a table of items. The order status is 'Open' and 'Confirmed'. The shipping status is 'Not Shipped' and 'Ready for Export'. The items table lists two products: 'No-Iron Textured Dress Shirt' and 'Modern Striped Dress Shirt'. The total shipping cost is €15.99, and the total order amount is €496.05.

Qty	Product ID	Name	Manufacturer	Tax Rate	Unit Sales Price	Tax Basis	Item Total
4	708141676305M	No-Iron Textured Dress Shirt		10.00 %	€35.99	€143.96	€143.96
3	69309284M-2	Modern Striped Dress Shirt		10.00 %	€97.00	€291.00	€291.00
Shipment Shipping Cost:							€15.99
Total Shipping Cost (EUR002):							€15.99
Shipping Total:							€15.99
Tax Total:							€45.10
Total:							€496.05

2. In the **Attributes** tab, the PAYONE-specific order attributes are displayed. These attributes support payment tracking, webhook processing, and order traceability.

Typical values include:

- **PAYONE Item Level Statuses** - This field is typically empty unless item-level payment status tracking is applicable.
- **PAYONE Order Amount Action Used** - This checkbox is typically not selected unless order amount-based payment actions have been applied.

- **PAYONE Merchant Reference** - This field contains the merchant reference associated with the order, for example: **333**Order-Number

This value is used to map webhook events to the corresponding order.

The screenshot shows the 'Merchant Tools' interface with the 'Ordering' tab selected. The breadcrumb trail is 'Merchant Tools > Ordering > Orders > Order: 00003719(RelArch)'. The 'Attributes' sub-tab is active. The main heading is 'Attributes for Order '00003719''. Below this, a note states: 'On this page you can edit the attributes of the order. Fields with a red asterisk (*) are mandatory. Click Apply to save changes. Click Reset to revert your changes.' The 'Settings for PAYONE Order' section contains a 'PAYONE Item Level Statuses' field. At the bottom, there are two fields: 'PAYONE Order Amount Action Used:' with a checkbox, and 'PAYONE Merchant Reference:' with a text input containing the value '33300003719'.

3. In the **Payment** tab, the **Payment Method** section displays the payment-related information stored for the order.

Typical values include:

- **Payment Method** - Displays the payment method used for the order, for example: PAYONE_COMMERCE_GOOGLEPAY
- **Processor** - Displays the payment processor used for the transaction, for example: PAYONE_COMMERCE
- **Transaction** Displays the transaction identifier, for example: 093128e8-ac77-47e2-bf7c-46XXXXXXXXXX
- **Amount** - Displays the order payment amount, for example: €XXX.XX
- **PAYONE Commerce Case ID** - Displays the PAYONE case identifier associated with the transaction
- **PAYONE Checkout ID** - Displays the PAYONE checkout identifier
- **PAYONE Payment Execution ID** - Displays the payment execution identifier created by PAYONE

- **PAYONE Checkout Reference** - Displays the checkout reference value, for example: 222Order-Number
- **PAYONE Checkout Payment Status** - Displays the payment status recorded for the checkout, for example: PAYMENT_NOT_COMPLETED
- **PAYONE Latest Payment Event Status** - Displays the latest webhook event status received for the payment, for example: PENDING_CAPTURE

These values can be used to verify payment processing progress and to correlate order records with PAYONE webhook events.

Merchant Tools > Checkout > Orders > Order: 00003719(RefArch)			
General Attributes Payment Notes History			
Payment Information for Order '00003719'			
Order Total:	€496.05		
Amount Paid:	€0.00		
Balance Due:	€496.05		
Invoice Number:	00022514		
Payment Status:	Not Paid		
Payment Method:	PAYONE_COMMERCE_SECURE_DIRECT_DEBIT Processor: PAYONE_COMMERCE Transaction: e49aa3df-506d-44f1-bebb-1e3cd5cc27e7 Amount: €496.05 PAYONE Commerce Case ID: b2db07f7-c151-46aa-b2d6-335949605d PAYONE Checkout ID: ad9d91c3-a389-4171-b091-20785d8edc2f PAYONE Payment Execution ID: e49aa3df-506d-44f1-bebb-1e3cd5cc27e7 PAYONE Checkout Reference: 22200003719 PAYONE Checkout Payment Status: PAYMENT_NOT_COMPLETED PAYONE Latest Payment Event Status: PENDING_CAPTURE		
	Billing Address:	Andreea Podit Unter den Linden 31 Bramen Altstadt undefined 20195 DE	

Note: The order number saved and displayed in **Business Manager** must remain below **16 characters** in total. When defining the order number format, this limit must include any additional prefixes or codes appended to the order number, such as the **Merchant Reference ID** (222) and the **Checkout Reference ID** (333). As these values are added to the order number, the combined result must still comply with the maximum supported length. To avoid display or processing issues, it is recommended to use a short and unique base order number format that allows sufficient space for the required PAYONE reference values.

4.2.1.2. Webhook Events

Webhook events created by the integration can be reviewed in **Manage Custom Objects** in Business Manager.

To access all the webhook events:

1. Navigate to:
Merchant Tools > Custom Objects > Manage Custom Objects
2. Select the custom object type **PayoneWebhookEvent**
3. Review the list of created webhook events

Finding a Specific Webhook Event

To locate a webhook event for a specific order:

1. Open the relevant order in Business Manager.
2. Copy the value from the **PAYONE Merchant Reference** field from the **Attributes** tab.
3. Go to the **Manage Custom Objects** page.
4. Open the **Advanced Filter**.
5. Set the filter condition as follows:
 - **Field:** Merchant Reference
 - **Operator:** equals
 - **Value:** enter the copied PAYONE Merchant Reference
6. Apply the filter to display the matching event records.

Merchant Tools > Custom Objects > Manage Custom Objects

Manage Custom Objects

This page allows you to manage custom objects based on your object type definitions.
Use the object type select box below to choose the object type definition for which you want to search custom objects. Use the object ID search field to further limit your search to objects with certain key values.
Click New to create new custom object instances for the selected object type. Click Delete to delete the selected custom object instances.

4.2.1.3. *Webhook Event Attributes*

When opening a webhook event, the following attributes are displayed:

- **ID** - The unique identifier of the webhook event
- **Processing Attempts** - The number of processing attempts made for the event. This value increases each time the **PAYONE Process Webhook Events** job runs.
- **Processing Status** - Displays the current processing result for the event. Typical values include:
 - PENDING
 - ERROR
- **Last Error Message** - Displays the most recent error message recorded during processing, if applicable
- **Payload** - Displays the webhook event payload received from PAYONE
- **Event Created** - Displays the date and time when the event was created
- **Type** - Displays the webhook event type
- **Merchant Reference** - Displays the merchant reference used to map the event to the related order

This information supports troubleshooting, event tracking, and verification of asynchronous payment processing within the PAYONE integration.

4.3. PayOne Process Webhook Events Job

The **PAYONE Process Webhook Events** job is responsible for processing the webhook event records stored as custom objects and performing the required follow-up actions on the related order.

When PAYONE sends an asynchronous payment event, the event is first stored as a PayoneWebhookEvent custom object. The **PAYONE Process Webhook Events** job then reads the queued events and evaluates the payment status information contained in each payload. Based on this information, the job executes the appropriate order-related processing logic, such as updating payment status handling, triggering order placement or failure processing, and recording traceability information on the order.

The job contains a job step **PayoneProcessWebhookEventsChunk** with the following configuration:

- ID PayoneProcessWebhookEventsChunk
- Description
- MaxItems

The screenshot displays the Salesforce Admin console interface for configuring the **PAYONE Process Webhook Events** job. The left sidebar shows the navigation menu with options like General, Schedule and History, Resources, Job Steps, Failure Handling, and Notification. The main content area is titled **PAYONE Process Webhook Events** and includes a **Job Parameters** section. On the right, a **Select and Configure Step** panel is open, showing the configuration for the **Custom:PayoneProcessWebhookEventsChunk** job step. The configuration includes fields for ID (PayoneProcessWebhookEventsChunk), Description, and MaxItems (set to 200). There is also a checkbox for **Always execute on restart** and a section for **Exit Status Rules** with an **Add Rule** button. At the bottom of the panel are **Back** and **Assign** buttons. The footer of the console shows the copyright notice for Salesforce, Inc. and the version information for the RefArch Time Zone.

Processing Behavior

During execution, the job performs the following actions:

- ✓ Retrieves queued PayoneWebhookEvent custom objects
- ✓ Validates the webhook event data
- ✓ Identifies the related order using the stored merchant reference
- ✓ Evaluates the webhook event type and payment status
- ✓ Executes the required order-related action based on the received payment event
- ✓ Updates event processing information for traceability and monitoring

If the event is processed successfully and no error occurs, the corresponding custom object should be removed as part of the cleanup process. This helps prevent unnecessary accumulation of processed webhook records and ensures that only pending or failed events remain available for operational review.

If an error occurs during processing, the event remains available in the custom object list with the relevant processing status and error information so that it can be investigated and retried.

Order Notes and Traceability

For traceability purposes, each successfully processed webhook event adds a new entry in the Notes tab of the related order in Business Manager.

The note contains a JSON record with the key details of the processed event, typically including:

- eventId - The unique identifier of the webhook event
- eventType - The type of webhook event received from PAYONE
- merchantReference - The merchant reference used to link the event to the related order
- paymentStatus - The payment status reported in the webhook payload
- flowAction - The action performed by the job as a result of the event processing
- processedAt - The date and time when the event was processed

4.4. Customer Service Center PayOne Extension

The PAYONE integration includes an extension for the Customer Service Center (CSC) in Salesforce Commerce Cloud Business Manager. This extension enhances the order details view and enables authorized merchant users to review PAYONE transaction information and perform supported post-order payment operations directly from the order page.

The extension is designed to support operational payment handling after order placement while maintaining alignment with PAYONE processing rules and merchant restrictions.

The PAYONE CSC extension extends the standard CSC order view by adding payment-related functionality for orders placed using supported PAYONE payment methods. It provides merchant users with visibility into the relevant PAYONE transaction details and enables valid follow-up actions such as:

- **Capture**
- **Refund**
- **Authorization Cancel**

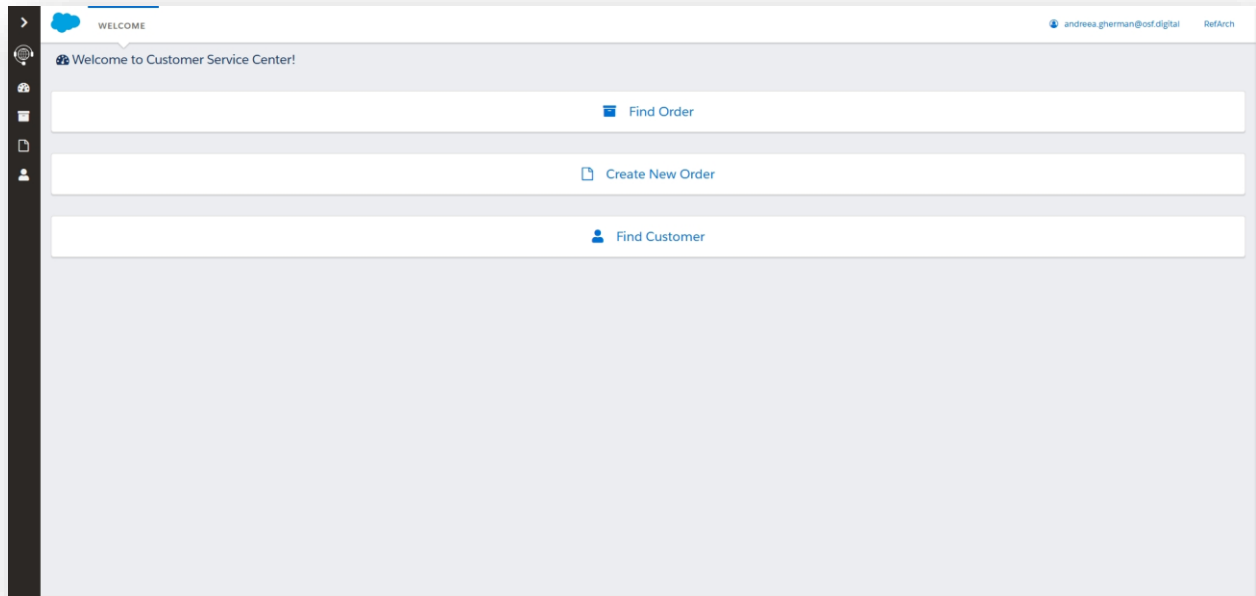

These actions are executed through the appropriate PAYONE service integrations configured for the cartridge.

The extension supports the following main functional areas:

- Visibility of the PAYONE CSC extension within the **Business Manager Customer Service Center**
- Display of PAYONE transaction summaries and current payment statuses
- **Item-level capture and refund** operations
- **Order-level capture and refund** operations
- **Authorization cancel** operations
- Prevention of PAYONE payment initiation from the Customer Service Center or during **on-behalf checkout**

The PAYONE CSC Extension can be accessed in **Business Manager** under:

Merchant Tools > Ordering > Customer Service Center

4.3.1. Create Order in CSC

A functional restriction applies to the PAYONE integration within the **Customer Service Center (CSC)**.

PAYONE payment methods cannot be used to initiate new payments directly from the Customer Service Center through the cartridge. To ensure compliance with this requirement, payment initiation through CSC must be prevented.

The following restrictions therefore apply:

- ✓ **PAYONE payment initiation from the Customer Service Center is disabled**
- ✓ **PAYONE payment methods are not available during checkout when a customer service user is logged in on behalf of a customer**

- ✓ **The Storefront button is disabled and unavailable**, preventing the merchant from starting a storefront checkout session from CSC

These restrictions ensure that PAYONE payment methods are used only in supported **shopper-driven checkout scenarios** and are not available in **agent-assisted payment initiation flows**.

The screenshot shows the 'NEW ORDER' page in the Salesforce Commerce Cloud interface. The left sidebar contains navigation links: 'Customer Service Center', 'Welcome', 'Orders', 'Create Order', and 'Customers'. The main content area is divided into several sections. At the top, there's a header with 'ORDER SEARCH', 'ORDER SUMMARY', and 'NEW ORDER' tabs. Below this, a user profile section shows 'Andrea Gherman' with email 'andrea.gherman.osf@gmail.com' and phone 'Number: 00000501'. To the right, a 'Ship To' address is listed: 'Pohlstrasse 81, Germany 38302, Wolfenbüttel undefined'. A 'Submit Order' button is visible in the top right. The main cart area displays a table with one item: 'Basic Leg Trousers' (Color: Navy, Size: 30, 883360352633M) with a quantity of 1, priced at \$195.00. The total for the item is \$195.00. Below the cart, there's a 'COUPONS AND SOURCE C...' section with a text input for a coupon code and an 'Add Coupon' button. On the right, a summary box shows the following totals: 'ITEMS TOTAL: 9495.00', 'QA_ORDER_PROMO (10.00% OFF): -519.50', 'DISCOUNTED ITEMS TOTAL: \$175.50', 'SHIPPING TOTAL: \$11.99', 'TAX TOTAL: \$18.75', and 'ORDER TOTAL: \$206.24'. The shipping method is '2-Day Express' with a cost of \$11.99. The bottom of the page has a copyright notice: '© 2020 Salesforce, Inc. All rights reserved.'

This screenshot shows the same 'NEW ORDER' page as the previous one, but with the 'Add Payment Method' modal open on the right side. The modal has a title 'Add Payment Method' and a 'Credit Card' option selected, indicated by a blue checkmark. The modal also contains a 'Cancel' button at the bottom right. The background content of the 'NEW ORDER' page is dimmed but still visible, showing the same cart item and totals as before. The left sidebar and top navigation remain the same. The copyright notice '© 2020 Salesforce, Inc. All rights reserved.' is visible at the bottom left.

On the **Find Order** page, selecting an order opens the **Order Summary** page, which displays the complete order information, including:

- **Order Number**
- **Creation Date**
- **Order Status**
- **Billing Address and Shipping Address**
- **Product Section**
- **Shipping Method used**
- **Order Summary**

The screenshot shows the 'ORDER SUMMARY' page. At the top, there's a navigation bar with 'ORDER SEARCH' and 'ORDER SUMMARY' tabs. The user 'andreea.gherman@osf.digital' is logged in. The main content area is divided into several sections:

- **More** button; selecting this button opens a new option displaying the **PayOne** link

Selecting the **PayOne Link** opens the **Customer Service Center PAYONE extension**. This page indicates that **payment initiation is not available** within the CSC extension and that **only post-order PAYONE actions** can be performed.

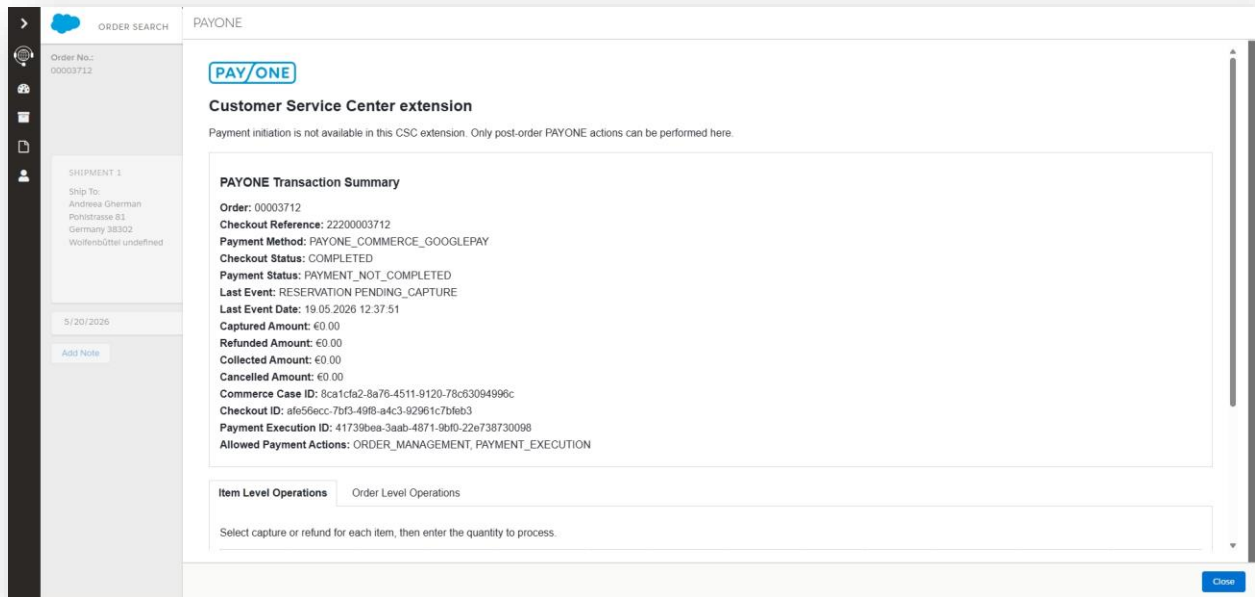

The **Customer Service Center PAYONE extension** window is divided into three main sections:

- ✓ **PAYONE Transaction Summary**
- ✓ **Item Level Operations**
- ✓ **Order Level Operations**

Within the **PAYONE Transaction Summary** section, the following order and payment details are displayed:

- Order Number
- Checkout Reference Number
- Payment Method used
- Checkout Status
- Payment Status
- Last Event
- Last Event Date
- Capture Amount
- Refunded Amount

- Collected Amount
- Cancelled Amount
- Commerce Case ID
- Checkout ID
- Payment Execution ID
- Allowed Payment Actions

The **Item Level Operations** section displays, in tabular format, all products included in the customer's order, along with the shipping cost and the **Capture Selected Items** button.

The product table contains the following columns and fields:

- **Select for Capture** – includes an active checkbox for each row
- **Select for Refund** – includes a disabled checkbox for each row
- **Quantity to Process** – includes editable fields, with the default value initially set to **1**
 - If the entered value exceeds the **Ordered Quantity**, a warning message is displayed, for example:
“Maximum capture quantity is 1 for this item.”

Item Level Operations
Order Level Operations

Select capture or refund for each item, then enter the quantity to process.

Select for Capture	Select for Refund	Qty To Process	Product	Description	Ordered Qty	Unit Amount (Gross)	Total Amount (Gross)	Captured Qty	Refunded Qty	Captured Amount (Gross)	Refunded Amount (Gross)	Collected Amount (Gross)
☒	☐	100 Maximum capture quantity is 1 for this item.	013742000443M	Silver and Purple Button Bracelet	1	€29.70	€29.70	0	0	€0.00	€0.00	€0.00
☐	☐	1	SHIPMENT	Shipping	1	€17.59	€17.59	0	0	€0.00	€0.00	€0.00

Please correct the highlighted quantity.

Capture Selected Items

☐	☐	1	SHIPMENT	Shipping	1	€6.59	€6.59	0	0	€0.00	€0.00	€0.00

Select at least one item for capture first.

Capture Selected Items

4.3.2.1. Partially Capture

Selecting only some of the items in the table and then selecting the **Capture Selected Items** button performs a **partial capture**. Upon successful completion, the following confirmation message is displayed:

“PAYONE action completed successfully”

After the partial capture, the **Item Level Operations** section is updated as follows:

- The checkboxes in the **Select for Capture** column are **disabled** for the items that were previously selected and remain **enabled** for the items that were not selected.
- The checkboxes in the **Select for Refund** column are **enabled** for the items that were previously selected and remain **disabled** for the items that were not selected.
- The **Capture Selected Items** button remains available.
- The **Refund Selected Items** button is displayed.

The **Order Level Operations** section displays the following warning message:

“Using order-level amount operations disables any further item-level PAYONE operations for this order. Use this tab only when you want to continue with amount-based processing.”

This section also displays the following amount-related details:

- **Order Total (Gross)**
- **Captured Amount (Gross)**
- **Refunded Amount (Gross)**
- **Collected Amount (Gross)**
- **Cancelled Amount (Gross)**
- **Capturable Amount (Gross)**
- **Refundable Amount (Gross)**

In addition, a **Capture Amount (Gross)** input field is available, with the maximum allowed value displayed below the field.

A **Cancel Authorization** dropdown is also provided, allowing the user to select one of the following reasons:

- **Consumer Request**
- **Undeliverable**

- **Duplicate**
- **Fraudulent**
- **Order Shipped in Full**
- **Automated Shipment Failed**

The section also includes the following action buttons:

- **Capture Amount**
- **Cancel Authorization**

If a partial amount is entered in the **Capture Amount** field and the **Capture Amount** button is selected, the **Captured Amount (Gross)**, **Collected Amount (Gross)**, **Capturable Amount (Gross)** and **Refundable Amount (Gross)** values are updated accordingly.

Also, below the **Capture Amount (Gross)** input field, the maximum value matches with the **Capturable Amount (Gross)** value.

The screenshot displays the SAP Customer Service Center extension interface. The top navigation bar includes 'ORDER SEARCH', 'ORDER SUMMARY', and 'PAYONE'. The main content area is titled 'Customer Service Center extension' and contains a message: 'Payment initiation is not available in this CSC extension. Only post-order PAYONE actions can be performed here.' Below this, a green bar indicates 'PAYONE action completed successfully'.

The 'PAYONE Transaction Summary' section provides details for Order: 00003705, including the Checkout Reference (2200003705), Payment Method (PAYONE_COMMERCE_CARD), and Checkout Status (BILLED). It also shows the Payment Status (PAYMENT_NOT_COMPLETED) and the Last Event (CAPTURE CAPTURED). The Last Event Date is 22.05.2025, 12:11:45. The summary lists the following amounts: Captured Amount: €50.00, Refunded Amount: €0.00, Collected Amount: €50.00, and Cancelled Amount: €0.00. The Commerce Case ID is €5c195ae-6872-47a5-8363-3373e036ad7, and the Checkout ID is 3af4Me3a-6302-4416-8f61-4a6528427f1. The Payment Execution ID is 84528115-8a27-44c7-8a8e-0b6916a1141. The Allowed Payment Action is PAYMENT_EXECUTION.

The 'Item Level Operations' section is active, showing 'Order Level Operations'. It prompts the user to 'Enter an amount to capture or refund at order level.' The table below shows the following values:

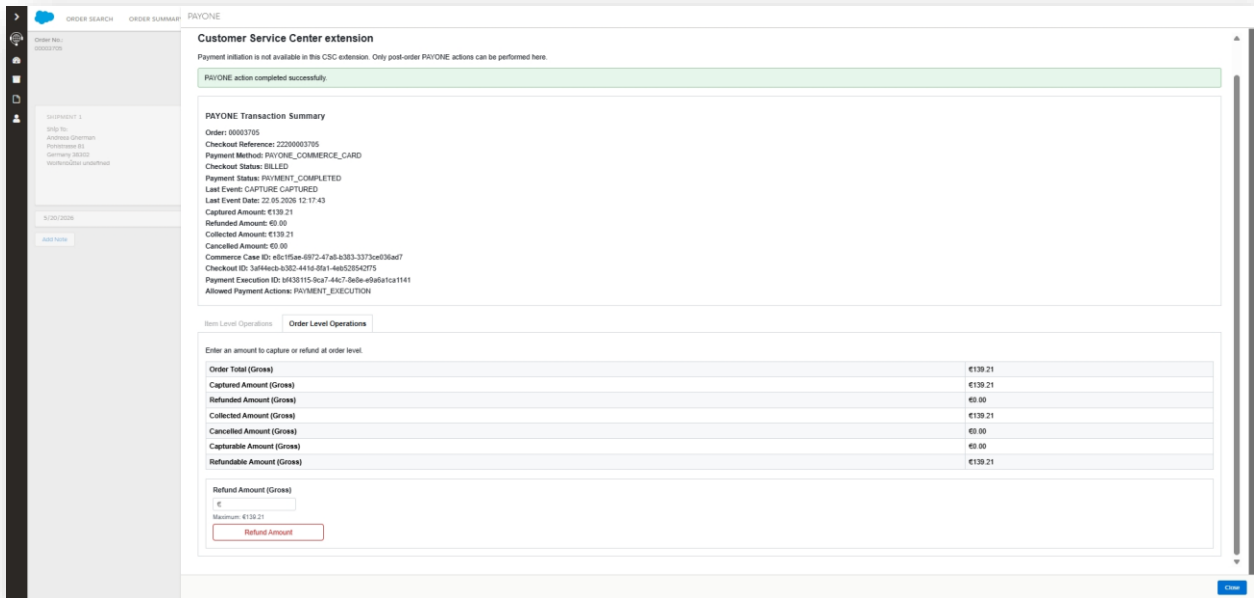

Order Total (Gross)	Value
Captured Amount (Gross)	€50.00
Refunded Amount (Gross)	€0.00
Collected Amount (Gross)	€50.00
Cancelled Amount (Gross)	€0.00
Capturable Amount (Gross)	€09.21
Refundable Amount (Gross)	€50.00

Below the table, there are two input fields: 'Capture Amount (Gross)' and 'Refund Amount (Gross)'. The 'Capture Amount (Gross)' field has a maximum value of €09.21, and the 'Refund Amount (Gross)' field has a maximum value of €50.00. The 'Capture Amount' button is highlighted in blue, and the 'Refund Amount' button is highlighted in red.

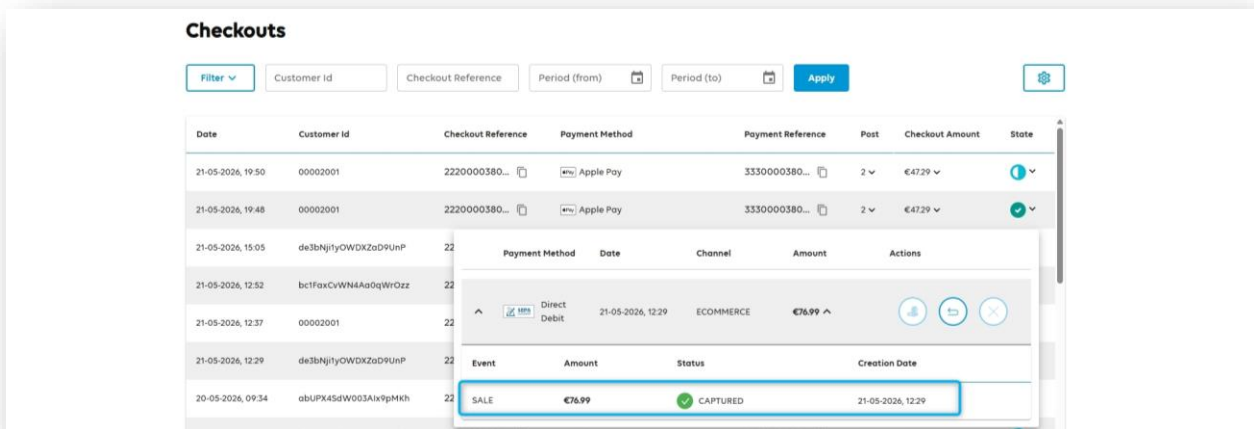

If the full amount is entered in the **Capture Amount (Gross)** input field and the **Capture Amount** button is selected, the displayed values are updated accordingly. In addition, the **Capture Amount** button is no longer displayed, and the **Refund Amount (Gross)** section becomes available.

The **Refund Amount (Gross)** section contains the following elements:

- **Refund Amount (Gross)** section title
- An empty input field with the currency displayed
- **Refund Amount** button

PAYONE Dashboard:

4.3.2.4. Partially Refunded

If an order has been **partially refunded**, the **PAYONE Transaction Summary** section in the **PayOne Extension** continues to display the complete order details.

However, in the **Item Level Operations** section, the following informational message is displayed:

“Item-level PAYONE actions are no longer available because an order-level amount action was already performed. Item-level tracking is no longer applicable for this order.”

In the **Order Level Operations** section, the following details are displayed:

- **Order Total (Gross)**
- **Captured Amount**
- **Refunded Amount**
- **Collected Amount**
- **Cancelled Amount**
- **Capturable Amount**
- **Refundable Amount**

In addition, the **Refund Amount** section is displayed, including:

- An input field for the refund amount
- The maximum value allowed to be refunded, displayed below the input field
- The **Refund Amount** button

4.3.2.5. Full Refunded

If an order has been **fully refunded**, the **PAYONE Transaction Summary** section in the **PayOne Extension** continues to display the complete order details.

However, the **Item Level Operations** and **Order Level Operations** sections are no longer displayed. Instead, the following informational message is shown to the user:

“No PAYONE CSC actions are currently allowed for this checkout state.”

The screenshot shows the PAYONE Customer Service Center extension interface. On the left, there is a sidebar with 'ORDER SEARCH' and 'SHIPMENT 1' details. The main content area displays the 'PAYONE Transaction Summary' for Order: 00003804. The summary includes details such as Checkout Reference, Payment Method, Checkout Status, Payment Status, Last Event, Last Event Date, Captured Amount, Refunded Amount, Collected Amount, Cancelled Amount, Commerce Case ID, Checkout ID, Payment Execution ID, and Allowed Payment Actions. A message at the bottom states: 'No PAYONE CSC actions are currently allowed for this checkout state.'

REFUND	€500.00	REFUNDED	22-05-2026, 12:41
REFUND	€300.79	REFUNDED	22-05-2026, 12:43

If an order is placed using the **PayOne Store Pay** payment method, the **PayOne Extension** is empty and displays the following informational message to the user:

“This order is not associated with a PAYONE payment instrument.”

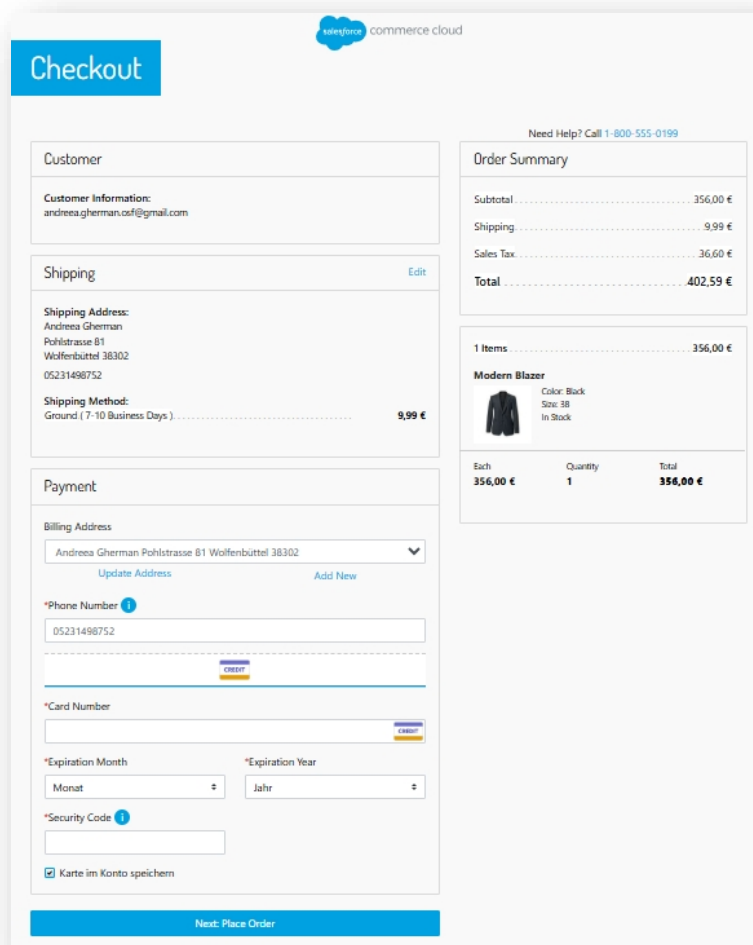

5. Storefront

On the Storefront, in the Checkout – Payment section, if the PayOne cartridge is disabled, the storefront falls back to the standard SFRA payment methods configuration.

In this scenario, only the payment methods provided by the default SFRA implementation are displayed to the customer. PAYONE-specific payment options are not available and are not shown in the list of payment methods during checkout.

This ensures that the checkout remains operational even when the **PayOne cartridge** is not enabled, while clearly separating the default SFRA payment functionality from the PAYONE integration.

Next: Place Order

When the **PAYONE cartridge** is enabled, the storefront displays the following PAYONE payment methods, depending on the configured availability conditions:

- ✓ **Payone Commerce Card**
- ✓ **Payone Commerce SEPA Direct Debit**
- ✓ **Payone Commerce Secured Invoice**
- ✓ **Payone Commerce Secured Installment**
- ✓ **Payone Commerce Secured Direct Debit**
- ✓ **Payone Commerce PayPal**
- ✓ **Payone Commerce Google Pay**
- ✓ **Payone Commerce Store Pay**

5.2. PAYONE Commerce Card

Payone Commerce Card is available in the storefront checkout as part of the PAYONE payment integration. This method supports the standard card payment flow and, where applicable, additional authentication handling.

The PayOne Commerce Card payment method is available for all supported countries.

For the PayOne Commerce Card, the payment is created when the shopper places the order and for the PayOne Commerce Card 3D Secure, the payment is following a pre-order PAYONE flow.

In the **PAYONE Portal**, the related checkout is identified using the **PAYONE Checkout Reference** stored in Business Manager. Within the matching checkout, payment information is available under the **Payments** tab.

The screenshot displays the PAYONE Portal interface. On the left, a 'Challenge Form' is shown with the following details:

- Cardholder Account Number: 411111*****1111
- Merchant Name: OstDigital
- Purchase Amount: 402.59 EUR
- Purchase Date: 2026-05-22 13:25:39

Below the details, it says 'Please enter the sent OTP Code' and provides a 'Code' input field with 'Cancel' and 'Pay' buttons.

On the right, the 'Checkouts' section is visible. It includes a 'Filter' button and a table of checkout records:

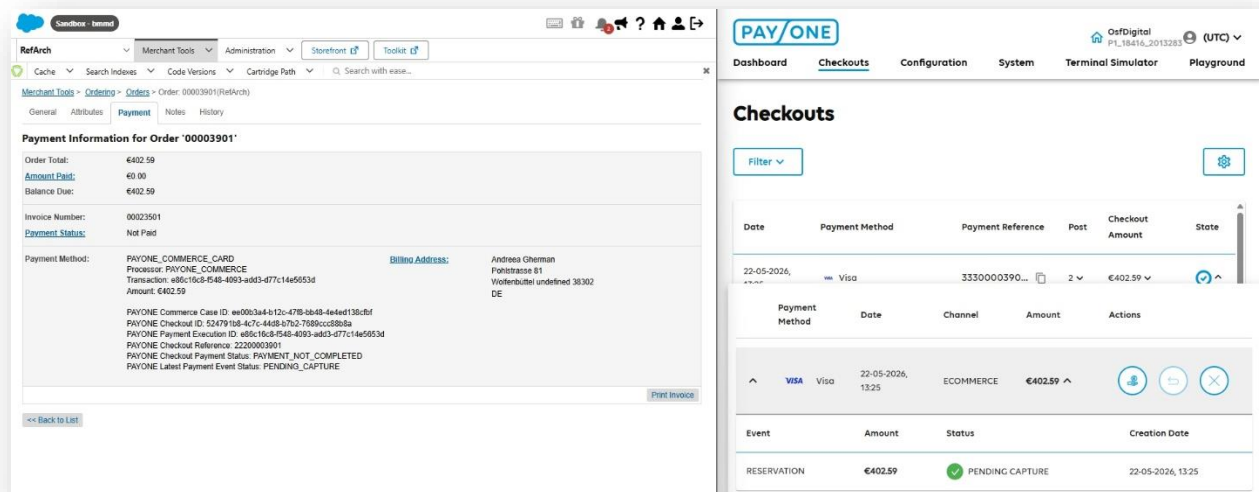

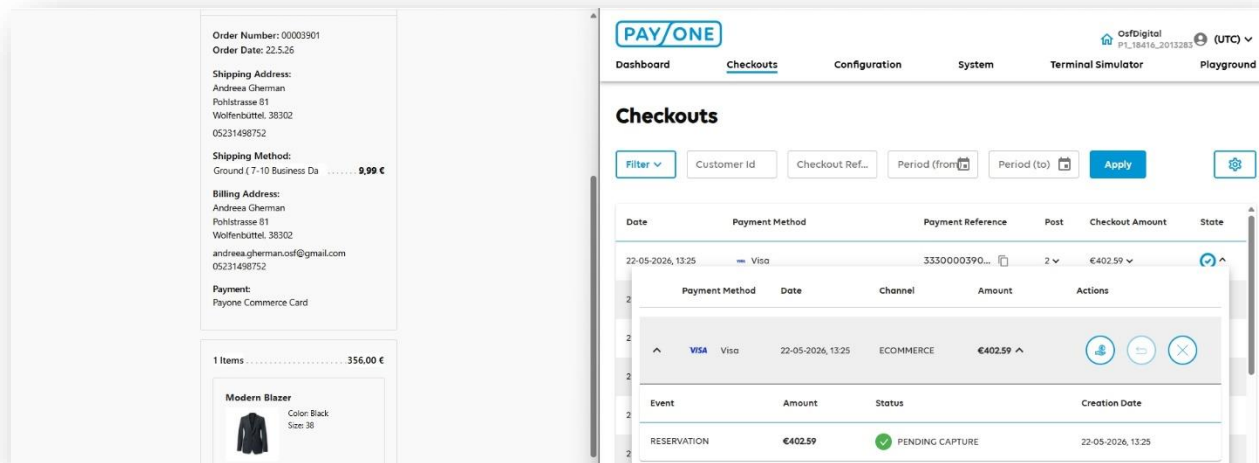

Date	Payment Method	Payment Reference	Post	Checkout Amount	State
22-05-2026, 13:25	Visa	3330000390...	2	€402.59	

Below this table, there is a detailed view for the selected checkout:

Payment Method	Date	Channel	Amount	Actions
VISA Visa	22-05-2026, 13:25	ECOMMERCE	€402.59	[Icons]

At the bottom, there is an 'Event' table:

Event	Amount	Status	Creation Date
RESERVATION	€402.59	REDIRECTED	22-05-2026, 13:25

5.3. Payone Commerce SEPA Direct Debit

Payone Commerce SEPA Direct Debit is available only when the basket currency is **EUR**. The payment is created when the shopper places the order.

This method is available only in the applicable currency context and follows the standard checkout flow for PAYONE order placement.

5.4. Payone Commerce Secured Invoice

Payone Commerce Secured Invoice is a secured BNPL payment method available only for supported checkout data.

This payment method is available only when:

- ✓ the basket currency is **EUR**
- ✓ the checkout address data corresponds to **Germany** or **Austria**

The payment is created when the shopper places the order.

This method follows the standard PAYONE checkout and order placement flow for eligible basket and address conditions.

5.5. Payone Commerce Secured Installment

Payone Commerce Secured Installment is a secured BNPL payment method with a two-step storefront flow.

This payment method is available only when:

- ✓ the basket currency is **EUR**
- ✓ the checkout address data corresponds to **Germany** or **Austria**
- ✓ the **billing address** and **shipping address** are identical

Payone Commerce Secured Installment follows a two-step interaction in the checkout:

1. The first selection of **Next** retrieves the installment options from PAYONE.
2. After an installment option is selected, the second selection of **Next** continues the standard SFRA checkout flow and completes the PAYONE payment execution.

This method is considered a **pre-order PAYONE flow**, which means PAYONE records may be created before the Salesforce Commerce Cloud order exists.

5.6. Payone Commerce Secured Direct Debit

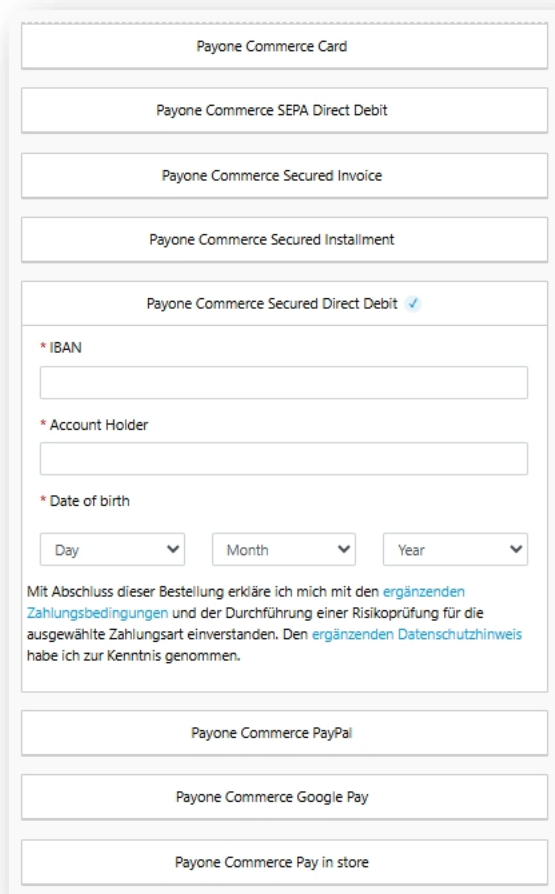

Payone Commerce Secured Direct Debit is a secured PAYONE payment method available only for supported country and currency combinations.

This payment method is available only when:

- the basket currency is **EUR**
- the checkout address data corresponds to **Germany** or **Austria**

The payment is created when the shopper places the order.

This method follows the standard storefront checkout sequence for eligible customers and address data.

The image shows a payment method selection interface. At the top, there are five buttons for different payment methods: "Payone Commerce Card", "Payone Commerce SEPA Direct Debit", "Payone Commerce Secured Invoice", "Payone Commerce Secured Installment", and "Payone Commerce Secured Direct Debit". The "Payone Commerce Secured Direct Debit" button is selected, indicated by a blue checkmark. Below this button is a form with three required fields: "* IBAN", "* Account Holder", and "* Date of birth". The "Date of birth" field is split into three dropdown menus for "Day", "Month", and "Year". Below the form fields is a disclaimer in German: "Mit Abschluss dieser Bestellung erkläre ich mich mit den [ergänzenden Zahlungsbedingungen](#) und der Durchführung einer Risikoprüfung für die ausgewählte Zahlungsart einverstanden. Den [ergänzenden Datenschutzhinweis](#) habe ich zur Kenntnis genommen." At the bottom, there are three more buttons: "Payone Commerce PayPal", "Payone Commerce Google Pay", and "Payone Commerce Pay in store".

5.7. Payone Commerce PayPal

Payone Commerce PayPal is available for all countries and uses a popup-based PAYONE flow during checkout.

A **PAYONE checkout** is created when the shopper selects the **PayPal** button.

After the shopper approves the payment in the PayPal popup, the storefront automatically continues through the payment submission and order placement steps. No additional manual selection of the standard checkout button is required after successful PayPal approval.

This payment method is considered a **pre-order PAYONE flow**, which means PAYONE records may be created before the Salesforce Commerce Cloud order is created.

5.7. Payone Commerce Google Pay

Payone Commerce Google Pay is available for all countries and supports wallet-based approval during checkout.

The payment is created after wallet approval, when the shopper places the order.

Depending on the scenario, the flow may involve:

- a non-redirect wallet approval flow
- a redirect-related flow

5.9. Payone Commerce Apple Pay

Payone Commerce Apple Pay is available in the storefront checkout as a wallet-based payment method through the PAYONE integration. This payment method is available for supported storefront configurations and applicable shopper devices and browsers that support Apple Pay.

Payone Commerce Apple Pay is available for **all countries**, subject to storefront configuration and device compatibility for Apple Pay usage.

For **Apple Pay**, the payment flow is initiated through the Apple Pay wallet interface during checkout.

After the shopper selects Apple Pay and completes the wallet authorization, the storefront continues the payment and order placement process through the PAYONE integration.

The image displays two side-by-side screenshots of the Payone Commerce checkout interface, showing the payment method selection screen. The left screenshot shows a list of payment methods with a blue 'Next: Place Order' button at the bottom. The right screenshot shows the same list with 'Payone Commerce Apple Pay' selected and a black 'Mit Apple Pay kaufen' button.

Payment Method	Status
Payone Commerce SEPA Direct Debit	Available
Payone Commerce Secured Invoice	Available
Payone Commerce Secured Installment	Available
Payone Commerce Secured Direct Debit	Available
Payone Commerce PayPal	Available
Payone Commerce Google Pay	Available
Payone Commerce Apple Pay	Selected (checked)
Payone Commerce Pay in store	Available
